On follow up. , Suggested follow up.

Reference : ATP III, NCEP Guidelines and National Lipid Association (NLA) 2014 Recommendations

As per most international and national guidelines including Lipid Association of India 2016 :

1. Lipoprotein and lipid levels should be considered in conjunction with other atherosclerotic cardiovascular disease (ASCVD) risk determinants to assess treatment goals and strategies.
2. Non-fasting lipid levels can be used in screening and in general risk estimation.

SOMNATH P PATIL Passport No-L 8272576 107 Bhagyashree Bungalow Lane No-04 Koregaon Park Pune Tel No: 919890581599 PID: 13793 Age:38.50 Years Sex:MALE	**Reference:Dr.--** Sample Collected At: **DPU-CCL** Dr. D. Y. Patil Medical College, Hospital & Research Centre, **Sant Tukaram Nagar, Pimpri Colony, Pune,**	**SID: 120513307** Collection Date: 10-03-2021 12:43 PM Registration Date: 10-03-2021 12:43 pm Report Date: 10-03-2021 08:35 PM

Test Description	Observed Value	Biological Reference Interval
TEST NAME		
Glycated Hemoglobin (HbA1C), by HPLC	**6.30**	4.0 to 5.6 %

Interpretation :
HbA1C level reflects the mean glucose concentration over previous 8-12 weeks and provides better indication of long term glycemic control.

For diagnosis of Diabetes Mellitus (>/= 18 yrs of age) :
5.7 % - 6.4 % : Increased risk for developing diabetes.
>/= 6.5 % : Diabetes

Therapeutic goals for glycemic control :
Adults : < 7%
Toddlers and Preschoolers : < 8.5% (but > 7.5 %)
School age (6-12 yrs) : < 8%
Adolescents and young adults (13 - 19 yrs) : < 7.5 %

Levels of HbA1C may be low as result of shortened RBC life span in case of hemolytic anemia.
Increased HbA1C values may be found in patients with polycythemia or post splenectomy patients.
Patients with Homozygous forms of rare variant Hb(CC,SS,EE,SC) HbA1c can not be quantitated as there is no HbA. In such circumstances glycemic control can be monitored using plasma glucose levels or serum Fructosamine.

The A1c target should be individualized based on numerous factors, such as age, life expectancy, comorbid conditions, duration of diabetes, risk of hypoglycemia or adverse consequences from hypoglycemia, patient motivation and adherence.

Patil Medical College, Hospital & Research Centre, **Sant Tukaram Nagar, Pimpri Colony, Pune,**	**SID: 120513307** Collection Date: 10-03-2021 12:43 PM Registration Date: 10-03-2021 12:43 pm Report Date: 10-03-2021 08:35 PM

Test Description	Observed Value	Biological Reference Interval
IgG level, serum by Nephelometry	**1,380.00**	13 - < 16 yrs : 509 to 1580 mg/dL 16 - < 18 yrs : 487 to 1327 mg/dL Adult : 700 - 1600 mg/dL
IgA level, serum by Nephelometry	**128.00**	13 - < 16 yrs : 52 to 319 mg/dL 16 - < 18 yrs : 60 to 337 mg/dL Adult : 70 - 400 mg/dL
IgM level, serum by Nephelometry	**40.50**	13 - < 16 yrs : 45 to 244 mg/dL 16 - < 18 yrs : 49 to 201 mg/dL Adult : 40 - 230 mg/dL

Used for : Detecting or monitoring of monoclonal gammopathies and immune deficiencies.

Clinical information :

Increased serum immunoglobulin concentrations occur due to polyclonal or oligoclonal immunoglobulin proliferation in hepatic disease (hepatitis, liver cirrhosis), connective tissue diseases, acute and chronic infections, as well as in the cord blood of neonates with intrauterine and perinatal infections.

Elevations of immunoglobulin G (IgG), immunoglobulin A (IgA), or immunoglobulin M (IgM) may occur in monoclonal gammopathies such as multiple myeloma (IgG, IgA), macroglobulinemia (IgM), primary systemic amyloidosis, monoclonal gammopathy of undetermined significance, and related disorders.

Decreased levels are found in patients with primary or secondary immune deficiencies.

Electrophoresis is usually required to interpret an elevated immunoglobulin class as polyclonal versus monoclonal.

Immunofixation is usually required to characterize a monoclonal protein.

If immunoglobulin quantitation is used to monitor the size of a monoclonal protein that is contained in a background of polyclonal mmunoglobulins, changes in the immunoglobulin quantitation may reflect changes in the background immunoglobulins. In these situations, serum protein electrophoresis should therefore be used to monitor the monoclonal protein.

Test Description	Observed Value	Biological Reference Interval
Gamma Glutamyl Transferase (GGT)		
Gamma GT(GGT),Serum by Carboxy substrate-kinetic	**37.00**	Male : (Unit : U/Lt.) 13 - 17 years : < 43 >or= 18 years : 8 - 61

Interpretation

* GGT is used to diagnose and monitor hepatobiliary diseases.
* Increased GGT and Alkaline Phosphatase indicate hepatobiliary diseases.
* Normal GGT activity and increased Alkaline Phosphatase is consistent with skeletal disease.
* May be used a screening test for occult alcoholism.
* Elevated GGT is seen in :
  1) Intra or post hepatic biliary obstruction (5 to 30 times normal)
  2) Infectious hepatitis (2 to 5 times normal)
  3) Alcoholism
  4) Sclerosing cholangitis
  5) Primary or secondary neoplasm
  6) Medications such as phenytoin and phenobarbitone

Test Description	Observed Value	Biological Reference Interval
Plasma Glucose :		
Plasma glucose fasting, by Hexokinase method	**108**	< 100 mg/dL 100 to 125 mg/dL : Impaired fasting glucose tolerance / Prediabetes >/= 126 mg/dL : Suggestive of diabetes mellitus (On more than one occasion) American Diabetes Association Guidelines 2020

Clinical Chemistry

Urea, serum by GLDH-urease	**21**	17 to 49 mg/dL
BUN-Blood Urea Nitrogen,serum by calculation	**9.81**	8 to 23 mg/dL
Creatinine, serum by Jaffe w/o deproteinization	**0.95**	0.6 to 1.2 mg/dL
Uric Acid, serum by Uricase method	**6.60**	Male : 3.50 to 7.20 mg/dL

** Uric acid is useful for 1. Diagnosis and follow up of renal failure. 2. Monitoring patients receiving cytotoxic drugs and a variety of other disorders, including gout, leukemia, psoriasis, starvation and other wasting conditions . * Increased uric acid is seen in following conditions : 1. Increased purine synthesis 2. Inherited metabolic disorders 3. Excess dietary purine intake 4. Increased nucleic acid turnover 5. Malignancy, cytotoxic drugs 6. Decreased urinary excretion (due to CRF) 7. Increased renal reabsorption . * Uric acid is decreased in : 1. Hepatocellular disease with reduced purine synthesis 2. Defective renal reabsorption 3. Overtreatment of uricemia (allopurinol or cancer therpies like 6-mercaptopurine, etc).*

Test Description	Observed Value	Biological Reference Interval
Clinical Chemistry :		
Calcium, serum by OCPC method	**11.20**	Adult : 8.4 to 10.2 mg/dL

Method : Colorimetric (o-cresolpthalein substrate) .
1. Calcium is useful for diagnosis and monitoring of a wide range of disorders including diseases of bone, kidney, parathyroid gland, or gastrointestinal tract .
2. Calcium ions play an important role in blood clotting, bone mineralization, musculature contractility and CNS functioning. .
3. Hypocalcemia is due to the absence or impaired function of the parathyroid glands or impaired vitamin-D synthesis. Chronic renal failure is also frequently associated with hypocalcemia due to decreased vitamin-D synthesis as well as hyperphosphatemia and skeletal resistance to the action of parathyroid hormone (PTH).
4. Hypercalcemia is mainly due to primary hyperparathyroidism (pHPT), and bone metastasis of carcinoma of the breast, thyroid gland, or lung. Severe hypercalcemia may result in cardiac arrhythmia.

TEST NAME		
Vitamin B12, serum by CMIA	**484.0**	187 - 883 pg/mL

Interpretation :

1. Vitamin B12 (cobalamin) is necessary for hematopoiesis and normal neuronal function.

2. Vitamin B12 is decreased in

Decreased Serum B12
Pregnancy
Contraceptive hormones
Malabsorption
Ethanol ingestion
Smoking
Strict vegan diet
Pernicious anemia

3. Serum methylmalonic acid and homocysteine levels are also elevated in vitamin B12 deficiency states. Active B12 (Holotranscobalamin) is low in Vitamin B12 deficiency.

4. Please correlate in case of patients taking vitamin B12 supplementation.

Test Description	Observed value	Biological Reference Interval
HOMA Index Insulin Resistance Test		
Plasma glucose fasting, by Hexokinase method	**107**	< 100 mg/dL 100 to 125 mg/dL : Impaired fasting glucose tolerance / Prediabetes >/= 126 mg/dL : Suggestive of diabetes mellitus (On more than one occasion) American Diabetes Association Guidelines 2020
Insulin Fasting, Serum by CMIA	**30.40**	Fasting : 2.5 to 25 µU/mL Peak upto 150 µU/mL
HOMA IR Index	**8.11**	> 2.5 indicates insulin resistance

Interpretation

1. As, the direct measurement of the insulin effect on the blood sugar concentration is not possible other indices are used for determining an insulin resistance.
2. One of the most common indices is the HOMA index (Homeostasis Model Assessment), which is calculated according to the following formula:
   HOMA index = fasting insulin (µU/ml) X fasting blood sugar (mg/dl) /405
3. Indications :
   * Adiposis (BMI > 28 kg/m²)
   * Suspected insulin resistance (metabolic syndrome, diabetes mellitus type 2)
   * Suspected polycystic ovary syndrome (PCO-S)
   * Cycle disturbances (e. g. amenorrhea)
   * Infertility
4. Reference ranges :
   > 2.0 indication for insulin resistance
   > 2.5 insulin resistance probable
   > 5.0 average value in patients with diabetes mellitus type 2

Test Description	Observed Value	Reference range & Units
TEST NAME		
Homocysteine,plasma by CMIA	**12.92**	Male : 5.08 to 15.39 µmol/Lt

Homocysteine concentration is an indicator of acquired folate or cobalamin deficiency, and is a contributing factor in the pathogenesis of neural tube defects. Currently, the use of homocysteine for assessment of cardiovascular risk is uncertain and controversial. Based on several meta-analyses, at present, homocysteine may be regarded as a weak risk factor for coronary heart disease, and there is a lack of direct causal relationship between hyperhomocysteinemia and cardiovascular disease. It is most likely an indicator of poor lifestyle and diet. Homocysteine concentrations >13 mcmol/L are considered abnormal in patients evaluated for suspected nutritional deficiencies (B12, folate) and inborn errors of metabolism. Homocysteine concentrations < or =10 mcmol/L are desirable when utilized for cardiovascular risk.

Test Description	Observed Value	Biological Reference Interval
TEST NAME		
25 - OH Vitamin D, serum by CMIA	**37.60**	Severe deficiency : < 10 ng/mL Mild to moderate deficiency : 10 to 19 ng/mL Optimum levels : 20 to 50 ng/mL Increased risk of hypercalciuria: 51 to 80 ng/mL Toxicity possible : > 80 ng/mL Ref. : Mayo Medical Laboratories These reference ranges represent clinical decision values, based on the 2011 Institute of Medicine report

Interpretation :

Vitamin D is vital for strong bones. It also has important, emerging roles in immune function and cancer prevention.

Vitamin D compounds in the body are exogenously derived by dietary means; from plants as 25-hydroxyvitamin D2 (ergocalciferol or calciferol) or from animal products as 25-hydroxyvitamin D3 (cholecalciferol or calcidiol).

Vitamin D may also be endogenously derived by conversion of 7-dihydrocholesterol to 25-hydroxyvitamin D3 in the skin upon ultraviolet exposure.

The total 25-hydroxyvitamin D (25-OH-VitD) level (the sum of 25-OH-vitamin D2 and 25-OH-vitamin D3) is the appropriate indicator of vitamin D body stores.

Patients with renal failure can have very high 25-OH-VitD levels without any signs of toxicity, as renal conversion to the active hormone 1,25-OH-VitD is impaired or absent.

Kindly corelate clinically, with supplementation history & repeat with fresh sample if necessary.

Test Description	Observed Value	Biological Reference Interval
CRP(hs) - C- Reactive Protein high sensitivity	**2.21**	See clinical information below . Method : Nephelometry / Immunoturbidimetry

Clinical Information :

1. C-reactive protein (CRP) is a biomarker of inflammation. Plasma CRP concentrations increase rapidly and dramatically (100-fold or more) in response to tissue injury or inflammation.

2. High-sensitivity CRP (hs-CRP) is more precise than standard CRP when measuring baseline (i.e. normal) concentrations and enables a measure of chronic inflammation. It is recommended for cardiovascular risk assessment. Atherosclerosis is an inflammatory disease and hs-CRP has been endorsed by multiple guidelines as a biomarker of atherosclerotic cardiovascular disease risk.

Low cardiovascular risk : < 2.0 mg/L
High cardiovascular risk : >/= 2.0 mg/L
Acute inflammation : > 10.0 mg/L

3. A single test for high-sensitivity CRP (hs-CRP) may not reflect an individual patient's basal hs-CRP level. Repeat measurement may be required to firmly establish an individual's basal hs-CRP concentration. The lowest of the measurements should be used as the predictive value.

Test Description	Observed Value	Biological Reference Interval
Anti SARS-CoV2 spike protein (S1/S2) IgG	**Positive (96.7)**	Negative : < 12.0 AU/mL Equivocal : >/=12.0 to < 15.0 AU/mL Positive : >/= 15.0 AU/mL Sample : Serum / Plasma Method : CLIA

Remarks :

* Assay is quantitative determination of SARS-CoV-2 IgG antibodies against S1/S2 spike protein.

* Assay provides an indication of the presence of neutralising IgG antibodies against SARS-CoV-2, thus of protective immunity.

* SARS-CoV-2 IgG antibodies usually appear after 2-3 weeks (14-21 days) of infection or 2 weeks post second dose of vaccination.

* Helpful to detect post vaccination immune response to all types of vaccines.

AU/mL	Results	Retest rules and interpretation
< 12.0	Negative	No retest is required. A negative result may indicate the absence or a very low level of IgG antibodies to the pathogen. The test could score negative in infected patients during the incubation period and in the early stages of inection.
>/=12 to < 15	Equivocal	A second sample should be collected and tested no less than one to two weeks later when the result is equivocal.
>/= 15	Positive	No retest is required. A positive result generally indicates exposure of the subject to the pathogen or post vaccination immune respone.

** SARS-CoV-2 IgG test is not useful for diagnosis of acute infection.
