Reference : ATP III, NCEP Guidelines and National Lipid Association (NLA) 2014 Recommendations

As per most international and national guidelines including Lipid Association of India 2016 :

1. Lipoprotein and lipid levels should be considered in conjunction with other atherosclerotic cardiovascular disease (ASCVD) risk determinants to assess treatment goals and strategies.
2. Non-fasting lipid levels can be used in screening and in general risk estimation.

Report Date:
24-02-2021 05:51 PM

| Test Description | Observed Value | Biological Reference Interval |
|------------------|----------------|-------------------------------|
|------------------|----------------|-------------------------------|

TEST NAME

| | | |
|--------------------------------------|------|--------------|
| Glycated Hemoglobin (HbA1C), by HPLC | 5.10 | 4.0 to 5.6 % |
|--------------------------------------|------|--------------|

Interpretation :

HbA1C level reflects the mean glucose concentration over previous 8-12 weeks and provides better indication of long term glycemic control.

For diagnosis of Diabetes Mellitus (≥ 18 yrs of age) :

5.7 % - 6.4 % : Increased risk for developing diabetes.

≥ 6.5 % : Diabetes

Therapeutic goals for glycemic control :

Adults : < 7%

Toddlers and Preschoolers : < 8.5% (but > 7.5 %)

School age (6-12 yrs) : < 8%

Adolescents and young adults (13 - 19 yrs) : < 7.5 %

Levels of HbA1C may be low as result of shortened RBC life span in case of hemolytic anemia.

Increased HbA1C values may be found in patients with polycythemia or post splenectomy patients.

Patients with Homozygous forms of rare variant Hb(CC,SS,EE,SC) HbA1c can not be quantitated as there is no HbA. In such circumstances glycemic control can be monitored using plasma glucose levels or serum Fructosamine.

The A1c target should be individualized based on numerous factors, such as age, life expectancy, comorbid conditions, duration of diabetes, risk of hypoglycemia or adverse consequences from hypoglycemia, patient motivation and adherence.

Gamma Glutamyl Transferase (GGT)

| | | |
|--|-------|---|
| Gamma GT(GGT),Serum by Carboxy substrate-kinetic | 16.00 | Female : (Unit : U/Lt.) 13 - 17 years : < 26 >or= 18 years : 5 - 36 |
|--|-------|---|

Interpretation

- * GGT is used to diagnose and monitor hepatobiliary diseases.
- * Increased GGT and Alkaline Phosphatase indicate hepatobiliary diseases.
- * Normal GGT activity and increased Alkaline Phosphatase is consistent with skeletal disease.
- * May be used a screening test for occult alcoholism.
- * Elevated GGT is seen in :
 - 1) Intra or post hepatic biliary obstruction (5 to 30 times normal)
 - 2) *Infectious hepatitis (2 to 5 times normal)*
 - 3) *Alcoholism*
 - 4) *Sclerosing cholangitis*
 - 5) *Primary or secondary neoplasm*
 - 6) Medications such as phenytoin and phenobarbitone

Test Description

Observed Value

Biological Reference Interval

Haematology :

Erythrocyte Sedimentation Rate, EDTA Whole Blood

13

Female under 50 Yrs : Upto 20mm/hr.
Female 50 - 85 Yrs : Upto 30mm/hr.
Female > 85 yrs : Upto 42mm/hr.
Results corrected to 18 deg. celsius

Technique : Automated Westergren Method .

1. ESR is markedly elevated in monodonal gammopathy such as multiple myeloma, in severe polyclonal hyperglobulinemia due to inflammatory disease, and in hyperfibrinogenemia.
2. Moderate elevations are common in active inflammatory disease such as rheumatoid arthritis, chronic infections, collagen disease and neoplastic disease
3. ESR has little diagnostic value in these disorders but can be useful in monitoring disease activity.
4. Useful in the diagnosis and in monitoring polymyalgia rheumatica and temporal arteritis.
5. Moderate increase is seen in pregnancy (beginning at the 10th to 12th week) and returns to normal about 1 month postpartum .
6. Red cells with an abnormal or irregular shape, such as sickle cells or spherocytes, hinder rouleaux formation and lower the ESR.

Plasma Glucose :

Plasma glucose fasting, by Hexokinase method

Observed Value

74

Biological Reference Interval

< 100 mg/dL
100 to 125 mg/dL : Impaired fasting
glucose tolerance / Prediabetes
>= 126 mg/dL : Suggestive of
diabetes mellitus
(On more than one occasion)
American Diabetes Association
Guidelines 2020

Clinical Chemistry

Urea, serum by GLDH-urease

17

17 to 49 mg/dL

BUN-Blood Urea Nitrogen,serum by calculation

8

8 to 23 mg/dL

Creatinine, serum by Jaffe w/o deproteinization

0.60

0.6 to 1.2 mg/dL

Uric Acid, serum by Uricase method

3.00

Female : 2.60 to 6.00 mg/dL

** Uric acid is useful for 1. Diagnosis and follow up of renal failure. 2. Monitoring patients receiving cytotoxic drugs and a variety of other disorders, including gout, leukemia, psoriasis, starvation and other wasting conditions*

*. * Increased uric acid is seen in following conditions :*

*1. Increased purine synthesis 2. Inherited metabolic disorders 3. Excess dietary purine intake
4. Increased nucleic acid turnover 5. Malignancy, cytotoxic drugs 6. Decreased urinary excretion
(due to CRF) 7. Increased renal reabsorption .*

** Uric acid is decreased in : 1. Hepatocellular disease with reduced purine synthesis
2. Defective renal reabsorption 3. Overtreatment of uricemia (allopurinol or cancer
therapies like 6-mercaptopurine, etc).*

|-------------------------------|----------------|-------------------------------|
| Clinical Chemistry : | | |
| Calcium, serum by OCPC method | 8.80 | Adult : 8.4 to 10.2 mg/dL |

Method : Colorimetric (o-cresolphthalein substrate) .

- 1. Calcium is useful for diagnosis and monitoring of a wide range of disorders including diseases of bone, kidney, parathyroid gland, or gastrointestinal tract .*
- 2. Calcium ions play an important role in blood clotting, bone mineralization, musculature contractility and CNS functioning. .*
- 3. Hypocalcemia is due to the absence or impaired function of the parathyroid glands or impaired vitamin-D synthesis. Chronic renal failure is also frequently associated with hypocalcemia due to decreased vitamin-D synthesis as well as hyperphosphatemia and skeletal resistance to the action of parathyroid hormone (PTH).*
- 4. Hypercalcemia is mainly due to primary hyperparathyroidism (pHPT), and bone metastasis of carcinoma of the breast, thyroid gland, or lung. Severe hypercalcemia may result in cardiac arrhythmia.*

| Test Description | Observed value | Biological Reference Interval |
|--|----------------|--|
| HOMA Index Insulin Resistance Test | | |
| Plasma glucose fasting, by Hexokinase method | 74 | < 100 mg/dL 100 to 125 mg/dL : Impaired fasting glucose tolerance / Prediabetes >= 126 mg/dL : Suggestive of diabetes mellitus (On more than one occasion) American Diabetes Association Guidelines 2020 |
| Insulin Fasting, Serum by CMIA | 5.40 | Fasting : 2.5 to 25 µU/mL Peak upto 150 µU/mL |
| HOMA IR Index | 0.99 | > 2.5 indicates insulin resistance |

Interpretation

- As, the direct measurement of the insulin effect on the blood sugar concentration is not possible other indices are used for determining an insulin resistance.
- One of the most common indices is the HOMA index (Homeostasis Model Assessment), which is calculated according to the following formula:

HOMA index = fasting insulin (µU/ml) X fasting blood sugar (mg/dl) /405

3. Indications :

- * Adiposis (BMI > 28 kg/m²)
- * Suspected insulin resistance (metabolic syndrome, diabetes mellitus type 2)
- * Suspected polycystic ovary syndrome (PCO-S)
- * Cycle disturbances (e. g. amenorrhea)
- * Infertility

4. Reference ranges :

- > 2.0 indication for insulin resistance
- > 2.5 insulin resistance probable
- > 5.0 average value in patients with diabetes mellitus type 2

| Test Description | Observed Value | Biological Reference Interval |
|----------------------------------|----------------|--|
| TEST NAME | | |
| 25 - OH Vitamin D, serum by CMLA | 22.90 | Severe deficiency : < 10 ng/mL Mild to moderate deficiency : 10 to 19 ng/mL Optimum levels : 20 to 50 ng/mL Increased risk of hypercalciuria: 51 to 80 ng/mL Toxicity possible : > 80 ng/mL Ref. : Mayo Medical Laboratories These reference ranges represent clinical decision values, based on the 2011 Institute of Medicine report |

Interpretation :

Vitamin D is vital for strong bones. It also has important, emerging roles in immune function and cancer prevention.

Vitamin D compounds in the body are exogenously derived by dietary means; from plants as 25-hydroxyvitamin D2 (ergocalciferol or calciferol) or from animal products as 25-hydroxyvitamin D3 (cholecalciferol or calcidiol).

Vitamin D may also be endogenously derived by conversion of 7-dihydrocholesterol to 25-hydroxyvitamin D3 in the skin upon ultraviolet exposure.

The total 25-hydroxyvitamin D (25-OH-VitD) level (the sum of 25-OH-vitamin D2 and 25-OH-vitamin D3) is the appropriate indicator of vitamin D body stores.

Patients with renal failure can have very high 25-OH-VitD levels without any signs of toxicity, as renal conversion to the active hormone 1,25-OH-VitD is impaired or absent.

Kindly correlate clinically, with supplementation history & repeat with fresh sample if necessary.

| Test Description | Observed Value | Biological Reference Interval |
|--|----------------|--|
| CRP(hs) - C- Reactive Protein high sensitivity | 1.82 | See clinical information below Method : Nephelometry / Immunoturbidimetry |

Clinical Information :

1. C-reactive protein (CRP) is a biomarker of inflammation. Plasma CRP concentrations increase rapidly and dramatically (100-fold or more) in response to tissue injury or inflammation.

2. High-sensitivity CRP (hs-CRP) is more precise than standard CRP when measuring baseline (i.e. normal) concentrations and enables a measure of chronic inflammation. It is recommended for cardiovascular risk assessment. Atherosclerosis is an inflammatory disease and hs-CRP has been endorsed by multiple guidelines as a biomarker of atherosclerotic cardiovascular disease risk.

Low cardiovascular risk : < 2.0 mg/L
High cardiovascular risk : \geq 2.0 mg/L
Acute inflammation : > 10.0 mg/L

3. A single test for high-sensitivity CRP (hs-CRP) may not reflect an individual patient's basal hs-CRP level. Repeat measurement may be required to firmly establish an individual's basal hs-CRP concentration. The lowest of the measurements should be used as the predictive value.
