Observed Value Biological Reference Interval

TEST NAME

Test Description

Glycated Hemoglobin (HbA1C), by HPLC 5.70 4.0 to 5.6 %

Interpretation:

HbA1C level reflects the mean glucose concentration over previous 8-12 weeks and provides better indication of long term glycemic control.

For diagnosis of Diabetes Mellitus (>/= 18 yrs of age) :

5.7 % - 6.4 %: Increased risk for developing diabetes.

>/= 6.5 % : Diabetes

Therapeutic goals for glycemic control:

Adults: < 7%

Toddlers and Preschoolers: < 8.5% (but > 7.5%)

School age (6-12 yrs): < 8%

Adolescents and young adults (13 - 19 yrs): < 7.5 %

Levels of HbA1C may be low as result of shortened RBC life span in case of hemolytic anemia. Increased HbA1C values may be found in patients with polycythemia or post splenectomy patients. Patients with Homozygous forms of rare variant Hb(CC,SS,EE,SC) HbA1c can not be quantitated as there is no HbA. In such circumstances glycemic control can be monitored using plasma glucose levels or serum Fructosamine.

The A1c target should be individualized based on numerous factors, such as age, life expectancy, comorbid conditions, duration of diabetes, risk of hypoglycemia or adverse consequences from hypoglycemia, patient motivation and adherence.

Test Description	Observed Value	Biological Reference Interval
Clinical Chemistry:		
Urea, serum by GLDH-urease	35	17 to 49 mg/dL
BUN-Blood Urea Nitrogen,serum by calculation	16.36	8 to 23 mg/dL
Creatinine, serum by Jaffe w/o deproteinization	1.33	0.6 to 1.2 mg/dL
Uric Acid, serum by Uricase method	<u>7.70</u>	Male: 3.50 to 7.20 mg/dL

^{*} Uric acid is useful for 1. Diagnosis and follow up of renal failure. 2. Monitoring patients receiving cytotoxic drugs and a variety of other disorders, including gout, leukemia, psoriasis, starvation and other wasting conditions . * Increased uric acid is seen in following conditions :

- 1. Increased purine synthesis 2. Inherited metabolic disorders 3. Excess dietary purine intake
- 4. Increased nucleic acid turnover 5. Malignancy, cytotoxic drugs 6. Decreased urinary excretion (due to CRF) 7. Increased renal reabsorption .
- * Uric acid is decreased in : 1. Hepatocellular disease with reduced purine synthesis
- 2. Defective renal reabsorption 3. Overtreatment of uricemia (allopurinol or cancer therpies like 6-mercaptopurine, etc).

Test Description

Vitamin B12, serum by CMIA **248.0** 187 - 883 pg/mL

Interpretation:

- 1. Vitamin B12 (cobalamin) is necessary for hematopoiesis and normal neuronal function.
- 2. Vitamin B12 is decreased in

Pernicious anemia

Decreased Serum B12	
Pregnancy	
Contraceptive hormones	
Malabsorption	
Ethanol ingestion	
Smoking	
Strict vegan diet	

- 3. Serum methylmalonic acid and homocysteine levels are also elevated in vitamin B12 deficiency states. Active B12 (Holotranscobalamin) is low in Vitamin B12 deficiency.
- 4. Please correlate in case of patients taking vitamin B12 supplementation.

Observed value Biological Reference Interval

HOMA Index Insulin Resistance Test

Plasma glucose fasting, by Hexokinase method 99 < 100 mg/dL

100 to 125 mg/dL : Impaired fasting glucose tolerance / Prediabetes >/= 126 mg/dL : Suggestive of

diabetes mellitus

(On more than one occasion) American Diabetes Association

Guidelines 2020

Insulin Fasting, Serum by CMIA 6.30 Fasting: 2.5 to 25 µU/mL

Peak upto 150 µU/mL

HOMA IR Index 1.54 > 2.5 indicates insulin resistance

Interpretation

- 1. As, the direct measurement of the insulin effect on the blood sugar concentration is not possible other indices are used for determining an insulin resistance.
- 2. One of the most common indices is the HOMA index (Homeostasis Model Assessment), which is calculated according to the following formula:

HOMA index = fasting insulin (µU/ml) X fasting blood sugar (mg/dl) /405

- 3. Indications:
 - * Adiposis (BMI > 28 kg/m²)
 - * Suspected insulin resistance (metabolic syndrome, diabetes mellitus type 2)
 - * Suspected polycystic ovary syndrome (PCO-S)
 - * Cycle disturbances (e. g. amenorrhea)
 - * Infertility
- 4. Reference ranges:
 - > 2.0 indication for insulin resistance
 - > 2.5 insulin resistance probable
 - > 5.0 average value in patients with diabetes mellitus type 2

Test Description
TEST NAME

25 - OH Vitamin D, serum by CMIA 32.00 Severe deficiency : < 10 ng/mL

Mild to moderate deficiency: 10 to 19 ng/mL

Optimum levels: 20 to 50 ng/mL

Increased risk of hypercalciuria: 51 to 80 ng/mL

Toxicity possible: > 80 ng/mL Ref.: Mayo Medical Laboratories These reference ranges represent clinical decision values, based on the 2011 Institute of Medicine report

Interpretation:

Vitamin D is vital for strong bones. It also has important, emerging roles in immune function and cancer prevention.

Vitamin D compounds in the body are exogenously derived by dietary means; from plants as 25-hydroxyvitamin D2 (ergocalciferol or calciferol) or from animal products as 25-hydroxyvitamin D3 (cholecalciferol or calcidiol).

Vitamin D may also be endogenously derived by conversion of 7-dihydrocholesterol to 25-hydroxyvitamin D3 in the skin upon ultraviolet exposure.

The total 25-hydroxyvitamin D (25-OH-VitD) level (the sum of 25-OH-vitamin D2 and 25-OH-vitamin D3) is the appropriate indicator of vitamin D body stores.

Patients with renal failure can have very high 25-OH-VitD levels without any signs of toxicity, as renal conversion to the active hormone 1,25-OH-VitD is impaired or absent.

Kindly corelate clinically, with supplementation history & repeat with fresh sample if necessary.

Observed Value

0.92

Biological Reference Interval

See clinical information below

Method: Nephelometry / Immunoturbidimetry

Clinical Information:

Test Description

- 1. C-reactive protein (CRP) is a biomarker of inflammation. Plasma CRP concentrations increase rapidly and dramatically (100-fold or more) in response to tissue injury or inflammation.
- 2. High-sensitivity CRP (hs-CRP) is more precise than standard CRP when measuring baseline (i.e. normal) concentrations and enables a measure of chronic inflammation. It is recommended for cardiovascular risk assessment. Atherosclerosis is an inflammatory disease and hs-CRP has been endorsed by multiple guidelines as a biomarker of atherosclerotic cardiovascular disease risk.

Low cardiovascular risk : < 2.0 mg/LHigh cardiovascular risk : >/= 2.0 mg/LAcute inflammation : > 10.0 mg/L

3. A single test for high-sensitivity CRP (hs-CRP) may not reflect an individual patient's basal hs-CRP level. Repeat measurement may be required to firmly establish an individual's basal hs-CRP concentration. The lowest of the measurements should be used as the predictive value.
